

A

Detection of LFP response onset

B

Detection of MUA response onset

Figure S1. Estimation of thalamorecipient layer.

Detection of the depth of thalamorecipient layer in P1 animal based on analysis of CSD of averaged cortical LFP response (**A**) and PSTH of short-latency MUA across cortical depth (**B**). Upper and lower borders are shown by red lines and are detected based on threshold-crossing by sink amplitude or MUA density (threshold for CSD – 20 standard deviations of CSD baseline before stimulus; threshold for MUA estimated as 5 standard deviations of spontaneous MUA).
